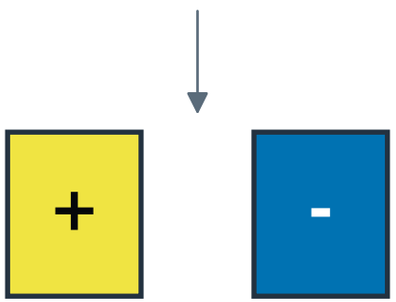
The mechanism ledger: exact charge balance does not freeze occupancy

Frozen winner: exact Q, variable M

$Q = N_+ - N_- = 0$ exactly

$M = N_+ + N_- + N_{bound}$ may change



Balanced pair creation changes M by +2
without changing Q

Trajectory evidence measures when and where this changing inventory becomes organised.

Exact-Q+M sibling control

$Q = 0$ and $M = M_{initial} > 0$

The same number of occupied cells is retained

Rearrangements may occur, but total M is fixed

This control does not reproduce the winner's strong-domain regime under the tested protocol.

MODEL SCHEMATIC - not a trajectory snapshot
